Personalized Commercial Questions | How are you deciding between laundry tablets, capsules, and powder? — 66%

Actual:

its like what I want to eat, like budget. If I'm going to eat like is it going to last? Can I freeze the food or am I going to be here next week to eat all this food

Predicted:

Mostly by the price, to be honest. If I can get like a small cheap box, I would rather do that first. I would probably go more for capsules, because I've seen those cheaper little ones, like £1-2, and I don't want to spend more on a big one if I don't know if I'm going to like it. Powder I would get only if it was cheaper, but mainly I'm just looking at what costs less and what is less waste if I end up not liking it.

Match Analysis:

OPEN-ENDED: The actual answer explains the choice mainly through budget and whether buying more will last or be wasted, while the predicted answer also centers on price and avoiding excess/low-value purchases. But the prediction adds a specific preference for capsules and a concern about 'not liking it,' which are not in the actual response, so by the open-ended rubric this is only partially aligned.

Personalized Commercial Questions | From your experience, do you feel you understand the damage plastic can cause? — 0%

Actual:

Sometimes when I say quick meals it might be like a pizza or something that I can just put in the oven and I won't have to worry. Because sometimes its not even just about the cooking, it's the cooking and the cleaning after.

Predicted:

Not really, if I'm honest. I just know people always say plastic is bad for the environment and paper is better, but I don't really know exactly what damage it causes. I've never really got the information about why, I've just been hearing it since I was little.

Match Analysis:

Question type: OPEN-ENDED. The actual response is nonresponsive to the plastic-damage question and instead talks about quick meals, pizza, and avoiding cooking/cleaning, while the predicted response says the speaker does not really understand what damage plastic causes. Since they share no core stance, insight, or sentiment, this is an unrelated mismatch, so it scores at the bottom of the open-ended scale.

Personalized Commercial Questions | You mentioned shops switching to paper — how do you compare paper/cardboard vs plastic environmentally? — 25%

Actual:

usually when I put the food in the box its still hot, so the cardboard it becomes really soft. So its like, it breaks easily and everything and I just put it in the normal bin.

Predicted:

I think paper or cardboard is better for the environment than plastic, yeah. That's what people always say and I've been hearing that since I was little, so I believe that. But if I'm honest, I don't really know exactly why it is better, I've never got the information on that.

Match Analysis:

OPEN-ENDED. The actual response focuses on a practical drawback of cardboard packaging—hot food makes it soft, it breaks easily, and they throw it in the normal bin—while the predicted response gives a general belief that paper/cardboard is environmentally better than plastic but without knowing why. These share the topic of paper/cardboard vs plastic, but not the same core point or stance, so this falls in the low open-ended band.

Personalized Commercial Questions | What are your thoughts on food waste and throwing food away? — 10%

Actual:

I'm not even sure if its paper or if its plastic. I think its paper but the inside it might be plastic, I don't know. So I'm not sure what I'm supposed to do with it.

Predicted:

I don't like throwing food away. I grew up knowing this, that you don't throw food, because food costs money, because people don't have access to food. So for me it's just wasteful.

Match Analysis:

Question type: OPEN-ENDED. The actual response expresses confusion about whether something is paper or plastic and uncertainty about how to dispose of it, while the predicted response gives a clear moral/economic objection to throwing food away as wasteful. These do not share the same core point or sentiment, so this falls in the unrelated/contradictory-low band.

Personalized Commercial Questions | Research says plastic packaging can keep food fresher — how do you weigh that against plastic waste? — 34%

Actual:

Maybe I'm just being lazy. I never thought it was the type of thing that is worthy for me to go and open the door or go to the other side of the house and put in a specific box.

Predicted:

I know plastic waste is not good, but if the plastic keeps the food fresh longer, I would probably buy that. For me, I don't like throwing food away, because it's wasting food and wasting money. So if plastic can make it last longer, yeah, I would lean to that even if paper is better for the planet.

Match Analysis:

Question type: OPEN-ENDED. The actual response is about being too lazy/seeing it as not worth the effort to sort or dispose of plastic properly, while the predicted response says plastic packaging is acceptable because it keeps food fresh longer and reduces food/money waste. Those share only a very broad theme of plastic, but not the same core point or reasoning, so this falls in the substantially different band.
